

Wireframe Tool/Methods Review

Responsive Wireframe Templates GIF:

This wireframe is really close to how I would like my website to look overall when it comes to its appearance on a desktop screen. The main appeal of the wireframe to me is the fact it is a very image friendly wireframe. By this I mean that while the page does have small sections of the page to provide general text based information the main focuses of the page are the images. I really like the image scroller at the top of the screen, as it is a really good way to either portray the most viewed or downloaded art on a page along with small sections of detail to describe the art. The page also shows a art gallery at the bottom of the page which would be great for categorizing all my different type of artwork so I can have them all on the same page without making the the page cluttered due to the organization of the image gallery.

Blog Animation:

Overall I feel when it comes to this wireframe design it works very well to better enhance the communication aspect of my own website. The design of this wireframe is very simple featuring a homepage for general information and then tabs leading to different sections of the of the webpage which all consist of blogs. While my website is not all about being able to blog between visitors I feel that I can adapted this general design style over to my website where people can not only view my content on but also fully communication with other visitors without having to constantly move from one tab to another. I feel by doing this visitors on my webpage would be able to reactive more real time answers to questions they may have instead of jumping over to another section of my webpage to make a post and then have to wait for a response. Also when it comes to the design of this wireframe I do really enjoy how on the homepage with a simply click you can change the background image of the header which can be a really nice touch when applied to and art design webpage like mind.
